Neo Clouds — principal architect evidence

Product: Neo Clouds Marketplace

Site: https://neocloudsmarketplace.com

Repository: https://github.com/kaparthi86/neocloudsmarketplace

Role this packet supports: Principal architect, AI infrastructure

Dossier date: 8 November 2026 (Pacific)

Source of truth: `main` at `1310d4d` (merge of pull request #20)

This packet is the product record for a principal architect review. It covers product ownership, technical design, release history, cost, adoption, and outside validation.

Numbers, invoices, user counts, testimonials, awards, and letters appear only when they exist. Empty tables mean the evidence has not been collected. They are not zero results.

What the architect owns

Neo Clouds is an open marketplace for spare GPUs and TPUs. A provider attaches a machine with a host agent. A buyer reserves a window on a machine that is attested and still heartbeating. The control plane is one Node.js service with a SQLite snapshot. It is a separate product from Student AI Hub.

The original technical work is the trust split: attestation proves which host answered, a heartbeat proves it is still online, and a per-reservation SSH user is created on ack and removed when the hold ends. Example machines and model previews are fixed catalog rows. They do not call a model provider and they do not open a host.

PDF: Neo-Clouds-Principal-Architect-Packet.pdf

Evidence map

Review area	What a principal packet needs	Where it is	Status
Product ownership	PRD, roadmap, tickets, launch plan, decision records	01-prd.md, 02-roadmap.md, 03-backlog.md, 04-launch-plan.md, 05-decision-records.md	Written from the shipped product
Technical originality	Architecture, AI workflow, prompts, code, model choices	06-architecture.md	Written from the repository. Preview is a fixed reply, not a model call
Product history	Dated screenshots, demos, release notes, versions	07-release-history.md	Release notes are dated from git. Screenshots and a demo recording are not in the repository
AI cost claims	Invoices, usage exports, cache logs, spreadsheets, before/after	08-cost-evidence.md	No provider invoice exists. The preview path does not call a model

Review area	What a principal packet needs	Where it is	Status
Adoption and impact	Users, analytics, retention, feedback, testimonials	09-adoption.md	Counters exist. No export, cohort, or testimonial is stored here
Independent validation	Articles, talks, awards, letters	10-validation.md	Drafts live in the repo. Publication, awards, and letters are not recorded

How to read a gap

A row marked **Not in the repository** is a collection task. Attach the file named in that section. Do not fill the cell with an estimate.

PRD — Neo Clouds Marketplace

Status: Early access, shipped

Owner: Product and principal architect, Neo Clouds

Date: 8 November 2026 (Pacific)

Canonical build: `main` @ `1310d4d`

Problem

AI teams need accelerators for a short window. Spare GPUs and TPUs sit in neo-clouds, labs, and colos while buyers wait on a hyperscaler quote. There is no open catalog that shows a specific machine, a listed hourly rate, and a way to reserve it only while that machine is actually online.

Users

User	Job
Provider	Put an idle GPU or TPU on one catalog and hand a buyer a host login for the reserved window
Buyer	Find a machine by accelerator, workload, region, and price, and receive access for a stated number of hours
Operator	Read contact notes, see which agents are heartbeating, and see which reservations are still open

Outcome

A buyer can reserve a live machine and receive a per-reservation SSH user. A provider can install one agent. The catalog can also show fixed example machines so the product is visible before the first live agent is attached.

In this release

- Public catalog of GPU and TPU listings, filterable by accelerator type, workload tag, and price
- Customer and provider API keys, with recovery and rotation
- Provider console and `scripts/neo-agent.mjs` for register, attest, heartbeat, provision, and revoke
- Reservation lifecycle: queue, access, complete, cancel, provision timeout, quiet-agent close
- Fixed example listings: H100 SXM5 80GB, A100 80GB, TPU v5e
- Fixed model preview cards: Llama 3.1 70B Instruct, Llama 3.1 8B Instruct, Gemma 2 9B Instruct
- Operator inbox at `/admin`
- Contact for general notes and investor notes
- SQLite on a persistent disk, Render starter plan
- Privacy and terms

Explicitly out of this release

- Card collection, checkout, escrow, and provider payouts
- A model call to any hosted LLM. Preview returns one fixed sentence
- Containers, vLLM, and a cluster scheduler
- Confidential computing
- A public sample API key, a leaderboard, a provider waitlist, and email-verification gating

Success measures

These are the operating measures. No result is recorded in this packet.

Measure	Definition
Live supply	Attested nodes whose heartbeat is inside the TTL
Time to first heartbeat	Provider account created to first fresh heartbeat
Ack rate	Live reservations that receive access, divided by live reservations created
Time to access	Reserve to provision ack
Clean completion	Live reservations that finish `completed`, divided by reservations that received access
Repeat supply	A provider who lists again
Agent-offline rate	Access that was closed because the heartbeat went stale
Provision-failure rate	Holds closed for timeout or because the window ended before access
Revoke completion	Closed live reservations whose host user was revoked

First market test, not a result: five live nodes, three acknowledged reservations, one clean completion, one provider who lists again.

Non-goals that protect the architecture

Availability is computed from attestation, heartbeat, and conflicting reservations. It is not a flag a provider can set. Example rows stay behind live rows on every sort. A heartbeat cannot turn an example into a live node.

Product roadmap

Date: 8 November 2026 (Pacific)

Horizon: what has shipped, what the first market test still requires, and what stays later on purpose.

Now — shipped on `main`

Theme	Shipped
Catalog	Home, marketplace, hardware / workload / price filters, GPU and TPU
Supply	Live node registration, challenge attestation, heartbeat, provider console
Demand	API-key reserve, buyer reservation view, access details after ack
Access	Per-reservation SSH user, created on ack, removed when the hold ends, is cancelled, or the agent goes quiet
Trust	Operator inbox, key recovery and rotation, rate limits, durable SQLite
Catalog before supply	Fixed example machines and canned model previews, kept distinct from live nodes
Company	General and investor contact addresses

Next — first market test

The product can accept a live machine. The market test is not done until the operating measures in the PRD have recorded results.

1. Five providers with an attested node and a fresh heartbeat.
2. Three buyers who reserve a live machine and receive an ack.
3. One of those reservations reaches `completed`.
4. One provider lists a second time.
5. Payments stay off until a live reservation has completed.

Later — after a completed live job

Item	Why it waits
Payments and payouts	A charge before a completed live job would bill a path that has not been proven
Usage ledger for accelerator-hours	Needs completed live hours to reconcile
Containers and vLLM	The agent currently opens a host user. A workload runtime is a second product
Cluster scheduling across providers	The reservation is the contract. A planner can consume it later
Postgres	SQLite on a disk is enough for the first cohort
Device attestation from the accelerator vendor	Challenge proof binds the agent. Vendor quotes are a stronger identity layer
Scoped keys and OAuth	Bearer keys are the early-access credential

Sequence the architect is holding

Supply and host access come before demand campaigns. Demand campaigns come before payments. Payments come before a claim that Neo Clouds is a paid cloud. Model previews stay a catalog surface until a live machine actually runs a model.

Tickets

These tickets are reconstructed from the repository history. Neo Clouds does not keep a separate issue tracker in this repo. Closed rows cite the pull request that landed the work. Open rows are the remaining scope from the roadmap.

Closed

ID	Ticket	Done	Evidence
NC-001	Stand up a separate marketplace repo and domain from Student AI Hub	5 Sep 2026	Commit `2fae460`
NC-002	Catalog filters for accelerator, workload, and price	5 Sep 2026	PR #1, PR #2
NC-003	Home, About, Contact, and marketplace at `/marketplace`	9 Sep 2026	PR #6
NC-004	Live hardware connect: attest, heartbeat, provision ack	15 Sep 2026	PR #7
NC-005	Operator contact path and privacy mailto	15 Sep 2026	PR #8
NC-006	System design record for the control plane	16 Sep 2026	PR #11
NC-007	Durable disk, operator inbox, rate limits, key recovery, reservation expiry	24 Sep 2026	PR #13, PR #14
NC-008	Remove sample key, stub attest, leaderboard, waitlist, and unused inference	25 Sep 2026	PR #14
NC-009	Put labeled example machines and model previews back, without making them live	25 Sep 2026	PR #15
NC-010	Investor contact address on the contact list	1 Oct 2026	PR #16
NC-011	Open and close a per-reservation SSH user, and mail the buyer when access is ready	8 Oct 2026	PR #17
NC-012	Home hero photograph in the site palette	8 Oct 2026	PR #18, PR #19
NC-013	Remove honesty banners and the matching disclaimer sentences	5 Nov 2026	PR #20

Open

ID	Ticket	Acceptance
NC-101	Record the first market test against the PRD measures	A dated export shows live supply, ack rate, clean completion, and repeat supply. Empty cells stay empty
NC-102	Capture dated product screenshots and a short demo	Files named in 07-release-history.md exist and match the build they claim
NC-103	Export Cloudflare analytics for the public site	A dashboard export is attached. Counts are not typed in by hand

ID	Ticket	Acceptance
NC-104	Payments after one completed live reservation	A completed live reservation exists first. Checkout is a later change with its own decision record
NC-105	Workload runtime on the reserved host	Containers or vLLM, scoped to the reservation user, with the same revoke path
NC-106	Move persistence off SQLite when a second cohort needs it	A decision record that names the operational limit SQLite hit

Not a ticket

Publishing a company revenue forecast, a user count, or a cost saving that has no source file.

Launch plan

Stage: Early access is deployed. The market test has not been scored.

Date: 8 November 2026 (Pacific)

Runbook already in the repo: LAUNCH.md

Launch bar that is already met

Gate	How it is met
A public site on its own domain	neocloudsmarketplace.com, separate from Student AI Hub
A process that stays up and keeps data	Render starter plan, disk at `/var/data`, `NEO_DB_PATH`
A provider can attach a real machine	Console plus `neo-agent` 0.2.0
A buyer can hold that machine only while the agent is online	Attest, heartbeat TTL, reservation conflicts
Access is closed when the hold ends	Agent release loop deletes the reservation user
An operator can read inbound notes	`/admin` with `ADMIN_API_KEY`
Abuse limits on account and contact routes	Rate limits when `NODE_ENV=production` or `RATE_LIMIT=1`
The catalog is understandable with no live agent	Example listings and model previews

Launch bar that is not met

Gate	Missing evidence
Five attested, heartbeating nodes	No dated node export in this packet
Three acknowledged live reservations	No reservation export
One clean completion	No completed-live-hour record
One provider who lists again	No repeat-supply record
Analytics export	Beacon is installed. The dashboard export is not in the repo

Rollout order

1. Operator sets `ADMIN_API_KEY` and mail (`RESEND_API_KEY` plus `NEO_MAIL_FROM`, or `NEO_MAIL_WEBHOOK_URL`).
2. Provider installs the agent on a host as root or passwordless sudo, with `NEO_SSH_PROVISION` left on.
3. Provider attests, heartbeats, and publishes a listing from the console.
4. Buyer registers a customer key and reserves that listing.
5. Agent acks. Buyer copies the user, host, and private key from My reservations. The private key is not emailed.
6. At window end, cancel, or stale heartbeat, the agent deletes that user.
7. Only after one reservation reaches `completed` does a payments design start.

Launch risks already designed for

Risk	Control
A demo row is treated as a live machine	Example rows are constants, `node_id` is null, and they sort after live rows
A dead host stays reservable	Availability requires a fresh heartbeat
A shared SSH user outlives the buyer	Username is `neo` plus ten hex characters from the reservation id. Revoke deletes only that pattern
A buyer is billed for a machine that never opened	`paymentsEnabled` is false. No checkout route exists
The operator inbox leaks API keys	Admin overview does not return customer keys or private keys

Abort

Stop inviting providers if acknowledged reservations are closed `agent_offline` more often than they complete, or if the agent cannot create the host user. Fix the host path before adding listings.

Decision records

Each record is a choice that is visible in the code on `main`. Dates are the repository dates of the change that locked the decision.

ADR-001 — Control plane first, orchestrator later

Date: 16 Sep 2026, design record in PR #11. Still true on 8 Nov 2026.

Decision: Ship a marketplace control plane: identity, catalog, reservation, and a thin host agent. Do not ship a cluster scheduler, a container runtime, or payouts in the first generation.

Why: The unsolved problem is discovering unused accelerators and binding a reservation to a host that is actually up. Orchestration has incumbents.

Consequence: A reservation ends in an SSH user on one host. It does not place a Kubernetes job.

ADR-002 — Attestation and heartbeat are different proofs

Date: 15 Sep 2026, PR #7. Required proof tightened 24 Sep 2026.

Decision: A live node must pass a challenge. The proof is `sha256(nonce:fingerprint)`. A later heartbeat is accepted only if the node is already live and the fingerprint matches. A heartbeat cannot promote an example or an unattested node.

Why: Identity and liveness fail in different ways. One proof for both lets a stale or spoofed host stay in the catalog.

Consequence: Availability is derived from attest, heartbeat TTL (default 90 seconds), and reservation conflicts.

ADR-003 — Example inventory is a constant, not a seed

Date: 25 Sep 2026. Removed seeded demo rows in PR #14. Added fixed examples in PR #15.

Decision: H100, A100, and TPU v5e examples live in `src/examples.js`. They are not database rows, they are not exclusive, and reserving one stores a note. It does not increment a fake reservation count and it does not open SSH. Live rows sort first.

Why: The catalog has to show the product before a provider is online, and reviewers have to be able to tell the two apart.

Consequence: Model preview is the same pattern: three cards, one fixed reply, `payment_collected: false`.

ADR-004 — One SSH user per reservation

Date: 8 Oct 2026, PR #17.

Decision: The agent creates `neo` plus the first ten hex characters of `sha256(reservation id)`, installs an ed25519 key, and deletes that user when the reservation is completed or cancelled, or

when the heartbeat is stale. `NEO_SSH_PROVISION=0` skips the host account and still allows an ack for development. The private key is stored on the reservation and shown to the buyer while the reservation is active. It is not included in email.

Why: A shared `neo` account would leave the previous buyer on the machine.

Consequence: The agent will only delete usernames that match `^neo[a-f0-9]{10}$`.

ADR-005 — Close a live hold when the agent goes quiet

Date: 8 Oct 2026, PR #17.

Decision: A `pending_provision` or `active` reservation with a node is cancelled `agent_offline` when the node is missing or the live heartbeat is stale. If the window has already ended, the reservation completes instead. Example reservations have no node and are skipped. A pending hold that misses the provision window (default 15 minutes) cancels `provision_timeout` and the operator is mailed.

Why: A buyer should not keep a hold on a host the provider has left.

Consequence: Quiet-agent close applies only to live nodes.

ADR-006 — Payments wait for a completed live job

Date: held since the early-access launch, restated when inference billing was removed on 25 Sep 2026.

Decision: `paymentsEnabled` stays false. There is no Stripe route and no usage ledger. Listed `$/hr` values are catalog rates.

Why: Charging against example rows, or against a reservation the agent never acked, would bill a machine the buyer did not receive.

Consequence: Cost claims in this packet have no invoice behind them. See 08-cost-evidence.md.

ADR-007 — One process, SQLite, starter instance

Date: 24 Sep 2026.

Decision: A single Node.js process (engines `>=22`, no npm dependencies) persists JSON snapshots to SQLite. Production uses the Render starter plan and a 1 GB disk. The free plan sleeps and cannot hold the disk.

Why: The first cohort is operator-sized. A second database, and a second service, would add an operations surface before there is a completed reservation.

Consequence: Horizontal scale and Postgres are an explicit later decision, NC-106.

ADR-008 — Remove surfaces that were not the product

Date: 25 Sep 2026, PR #14.

Decision: Remove simulated chat completions, the public sample key, stub attestation, the leaderboard, the provider waitlist, and unused email verification. Keep key recovery and rotation.

Why: Those surfaces let a reviewer believe a GPU had run, or that a waitlist was a supply pipeline.

Consequence: The only model path left is the labeled preview in ADR-003.

ADR-009 — Investor notes are a separate mailbox

Date: 1 Oct 2026, PR #16.

Decision: Contact intent `investor` is stored in the operator inbox and, when mail is configured, sent to `NEO_INVESTOR_EMAIL` (default `investorsneoclouds@googlegroups.com`). General notes go to the operator address.

Why: Investor mail and support mail are different readers.

Consequence: The contact page lists both addresses.

ADR-010 — The site does not carry a disclaimer strip

Date: 5 Nov 2026, PR #20.

Decision: Remove the gold honesty banners and the matching sentences in page copy, reservation notes, and customer email. Leave the behavior: example rows stay simulated, and `paymentsEnabled` stays false.

Why: The strip was a banner. The product behavior is enforced in the reservation and preview paths.

Consequence: A reviewer should read the code and this packet, not a banner, to see what a row will do.

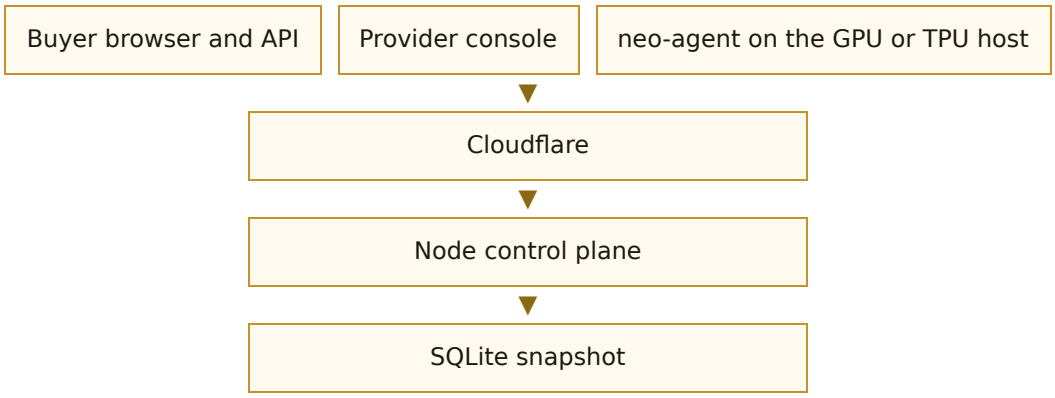

Architecture, workflow, and model choices

Date: 8 November 2026 (Pacific)

Code: repository `main` @ `1310d4d`

Longer design note: SYSTEM_DESIGN.md (the status line in that file is older than PR #17 and PR #20; this file matches the running control plane)

System context

The control plane is `src/server.js` and the domain modules under `src/`. Static pages live in `public/` and are served from an allowlist, not from an open directory. The agent is `scripts/neo-agent.mjs`, version 0.2.0.

Reservation workflow

1. Provider → Control plane: Register node live=true
2. neo-agent → Control plane: Attest challenge response
3. neo-agent → Control plane: Heartbeat
4. Provider → Control plane: Publish listing
5. Buyer → Control plane: Reserve hours
6. Control plane → Buyer: pending_provision
7. neo-agent → Control plane: Poll pending
8. neo-agent → neo-agent: Create user neo plus reservation hash
9. neo-agent → Control plane: Ack host, user, private key
10. Control plane → Buyer: active, key shown on the reservation
11. neo-agent → Control plane: Poll releases after complete, cancel, or stale heartbeat
12. neo-agent → neo-agent: Delete that user
13. neo-agent → Control plane: Revoke

States that matter:

State	Meaning
`pending_provision`	Live reserve, waiting for the agent
`active`	Agent acked, or an example reserve stored a note
`completed`	Window ended on an active hold
`cancelled`	`provision_timeout`, `ended_before_provision`, `agent_offline`, or the buyer cancelled

Example reserves skip the agent. `node_id` is null. `connection_info` is only `{ note: "Simulated reservation." }`.

AI workflow that actually runs

Preview requires an API key and is rate limited. The reply is `This is a canned example from Neo Clouds.` No prompt is sent to Llama, Gemma, OpenAI, Anthropic, or any other model host. No token usage is recorded. No GPU is scheduled.

There is no prompt library, no tool-calling graph, no retrieval index, and no model router in this repository. Those were removed with the old chat surface on 25 Sep 2026.

Model and provider choices

Choice	What it is	What it is not
Llama 3.1 70B Instruct on the example H100 row	A catalog card with listed token rates	A call to Meta, Groq, Together, or a local vLLM
Llama 3.1 8B Instruct on the example A100 row	A catalog card	A served model
Gemma 2 9B Instruct on the example TPU v5e row	A catalog card	A call to Google AI or a TPU runtime
Listed GPU and TPU hourly rates	Discovery prices on the listing	An invoice or a contracted price
neo-agent on the provider's own host	The provider's machine, the provider's SSH	Neo Clouds-operated capacity

The architect's model decision is to show the catalog shape buyers expect, and to refuse to pretend a preview executed a model. A later decision can attach a real runtime to a live reservation. That decision is NC-105 and it is open.

Repository map

Path	Role
`src/server.js`	HTTP allowlist and routes
`src/examples.js`	Example machines, model cards, preview reply
`src/listings.js`	Live listings merged with examples, live rows first
`src/reservations.js`	Reserve, cancel, complete

Path	Role
`src/lifecycle.js`	Window end, provision timeout, quiet agent
`src/agent.js`	Heartbeat, attest check, ack, release, revoke
`scripts/neo-agent.mjs`	Host user lifecycle
`src/auth.js`	`nck_` customer keys, `nkp_` provider keys, recover, rotate
`src/db.js`	SQLite snapshot
`src/admin.js`	Operator overview
`public/`	Site

Originality, stated narrowly

The novel piece is the binding of a marketplace reservation to a single host identity, a liveness proof, and a user that exists only for that reservation. The model cards are not an original model. The preview sentence is not an original prompt system.

Release history

Date of this list: 8 November 2026 (Pacific)

Versions: Neo Clouds is early access. The agent reports `agent_version` `0.2.0`. The site has no separate semver. History below is the `main` merge history.

Screenshots and a demo recording are not in this repository. The capture list at the end is the set to attach. Do not backdate a screenshot to a release it does not show.

Versions

Version	Date	What changed
Marketplace split	5 Sep 2026	Standalone repo, GPU and TPU catalog, filters
Site	9 Sep 2026	Home, About, Contact, app moved to `/marketplace`
Live connect	15 Sep 2026	Agent attest, heartbeat, provision ack. Contact email. Cloudflare beacon added to public pages
Design record	16 Sep 2026	System design document
Launch ops	24 Sep 2026	Disk, operator inbox, rate limits, key recovery, reservation expiry
Scope cut	25 Sep 2026	Sample key, stub attest, leaderboard, waitlist, and unused inference removed
Examples	25 Sep 2026	Fixed H100, A100, TPU rows and three model previews
Investor path	1 Oct 2026	`investorsneoclouds@googlegroups.com` on contact
Access 0.2.0	8 Oct 2026	Per-reservation SSH user, revoke, buyer mail, quiet-agent close
Hero	8 Oct 2026	Rack photograph, then the gold and blue rack row
Copy	5 Nov 2026	Honesty banners and the matching disclaimer sentences removed

Release notes

5 Nov 2026 — copy

The gold strips are gone from Home, Marketplace, About, Contact, the console, and the system-design page. Health and config no longer return banner text. Reservation notes and customer mail no longer carry the payment sentence. Example rows are still simulated. `paymentsEnabled` is still false. PR #20.

8 Oct 2026 — access

A live ack creates a Linux user for that reservation and returns the private key on the reservation. The agent deletes the user when the reservation completes, is cancelled, or the heartbeat is stale. The buyer is mailed when access is ready. The private key stays on the reservation page. PR #17. The same day, the home hero became a gold and blue rack row. PR #19.

1 Oct 2026 — investor contact

The contact page lists a general address and an investor address. Investor intent is mailed to `NEO_INVESTOR_EMAIL` when mail is configured. PR #16.

25 Sep 2026 — examples after the cut

Seeded demo inventory, the public sample key, stub attestation, the leaderboard, the provider waitlist, and the unused chat API were removed. Fixed example machines and canned model previews were then added so the catalog still shows the product. Live rows stay first. PR #14 and PR #15.

24 Sep 2026 — launch ops

The service moved to the Render starter plan with a disk. Accounts can recover and rotate keys. Reservations expire. The operator inbox can see contact notes without receiving API keys. PR #13 and PR #14.

15–16 Sep 2026 — a provider can connect a machine

`neo-agent` can attest, heartbeat, and ack. The system design document describes that control plane. PR #7 and PR #11.

5–9 Sep 2026 — the marketplace is its own product

The repo was split from Student AI Hub. The catalog gained hardware, workload, and price controls. Home, About, and Contact shipped. PR #1, PR #2, and PR #6.

Screenshots and demo — not attached

Capture these against production or a build you name, and keep the date in the filename.

File to add	Shows
`home-YYYY-MM-DD.png`	Home hero and the first section
`marketplace-listings-YYYY-MM-DD.png`	Live rows, if any, and the example rows beneath them
`marketplace-reserve-YYYY-MM-DD.png`	Reserve dialog
`marketplace-models-YYYY-MM-DD.png`	The three preview cards
`console-YYYY-MM-DD.png`	Provider console and the agent command
`reservations-YYYY-MM-DD.png`	A reservation after ack, with the key visible only in that capture's private archive

File to add	Shows
`demo-YYYY-MM-DD.mp4`	Register, attest, reserve, ack, and revoke

Do not put a private key in a screenshot that leaves the operator's archive. A demo can show the user and host and redact the key.

AI cost evidence

Date: 8 November 2026 (Pacific)

Finding: Neo Clouds has no AI provider invoice, no token usage export, no cache log, and no before-and-after cost comparison. A cost claim cannot be made from this repository.

Why there is no invoice

The model preview path does not call a provider. `POST /v1/models/preview` returns a fixed sentence from `src/examples.js`. It writes no usage record. The cards named Llama 3.1 70B, Llama 3.1 8B, and Gemma 2 9B are catalog metadata.

Listed hourly rates on example machines are discovery prices. They are not what Neo Clouds paid and not what a buyer was charged. `paymentsEnabled` is false. There is no Stripe account in this product.

The control plane's own hosting cost is a Render starter instance plus a 1 GB disk, and Cloudflare in front of the site. Those invoices are not stored in the repository. Attach them below if you want hosting cost in the packet. Do not describe that hosting bill as model spend.

Evidence to attach, when it exists

Artifact	File to add	What it must show	In this packet
Provider invoice	`invoices/YYYY-MM.pdf`	Provider name, period, SKU, quantity, amount, currency	Not in the repository
Usage export	`usage/YYYY-MM.csv`	Model or accelerator id, tokens or hours, timestamp	Not in the repository
Cache log	`cache/YYYY-MM.log`	Hit, miss, key, bytes, or tokens saved	Not in the repository. No cache exists
Calculation sheet	`cost/YYYY-MM.xlsx`	Formula from the export to a monthly total	Not in the repository
Before and after	`cost/before-after.md`	Same workload, two measured periods, both exports linked	Not in the repository

Worksheet, left blank on purpose

Period	Provider	SKU	Quantity from export	Rate from invoice	Computed total	Notes

A number typed into this table without the export and the invoice is not a cost claim.

What a later comparison is allowed to say

After NC-105, a live reservation that runs a named model can be compared with the listed card rate and with the provider invoice for that period. Until those three files exist, the honest statement is: Neo Clouds has not spent model-provider money, because it has not called a model provider.

Adoption and impact

Date: 8 November 2026 (Pacific)

Finding: This repository does not contain user counts, a retention cohort, customer feedback, or a testimonial. The site has instrumentation. The measurements have not been exported into this packet.

What is instrumented

Signal	Where it lives	What this packet has
Page analytics	Cloudflare Web Analytics beacon on the public pages, since 15 Sep 2026	The beacon. Not a dashboard export
Process health	`GET /api/health` reports `accounts`, `listings`, `liveNodes`, `onlineLiveNodes`	The fields. Not a dated snapshot
Reservations	SQLite snapshot on the server disk	Not exported
Contact notes	Operator inbox	Not exported

Health counts are process memory plus the local snapshot. They are not a public user total, and they mix example listings with live ones if you read `listings` without splitting `example`.

Measures, unfilled

Measure	Definition	Result
Registered accounts	Rows in `accounts` on a named date	Not exported
Live supply	Attested nodes inside the heartbeat TTL	Not exported
Reservations created	Live and example, reported separately	Not exported
Ack rate	See the PRD	Not exported
Clean completion	See the PRD	Not exported
Repeat reserve, 7 day	Buyers with a second live reserve	Not computed
Repeat supply	Providers with a second listing week	Not computed

Feedback and testimonials

Source	File to add	In this packet
Contact-form notes, with permission	`feedback/YYYY-MM-DD.md`	Not exported. The inbox is private
A named customer quote	`testimonials/name.md` with the date and the permission	None
A named provider quote	`testimonials/name.md`	None

Do not write a quote from a contact note unless that person agreed to be cited. Do not invent a company name.

Impact statement that is currently allowed

Neo Clouds is an early-access marketplace with a live path for one host and a catalog of example machines. Impact on buyers, hours delivered, and money saved has not been measured in this packet. The first market test in the roadmap is the measurement.

Independent validation

Date: 8 November 2026 (Pacific)

Finding: The repository holds drafts written for Neo Clouds. It does not hold a published article URL, a conference program, an award, or a letter from a customer or an outside expert.

What exists in the repository

Artifact	Where	What it is
System design	SYSTEM_DESIGN.md, `public/system-design.html`	The architect's own design record, 16 Sep 2026. The HTML page is not routed by the server
Hardware guide	HARDWARE.md	Operator instructions for the agent
Executive article draft	marketing/linkedin-executive-article.md	A draft. This packet does not claim it was posted
This dossier	`docs/principal-architect/`	Internal evidence, not independent validation

An artifact written by the same architect is a work sample. It is not independent validation.

What would count, and is absent

Kind	File to add	Required contents
Published article	`press/article.md`	Publisher, date, URL, and the sentence that mentions Neo Clouds
Conference	`press/talk.md`	Event, date, session title, and a program link
Award	`press/award.md`	Grantor, date, and the citation
Customer letter	`letters/customer-YYYY-MM-DD.pdf`	Named organization, date, and what they used
Expert letter	`letters/expert-YYYY-MM-DD.pdf`	Named person, role, date, and what they reviewed

Category context, not company proof

Public market research can frame the category. It is not validation of Neo Clouds. If a review packet cites it, keep the publisher and the date on the sentence, and keep it away from any Neo Clouds revenue figure.

Examples a reviewer can check, as category context only:

- Synergy Research Group, 13 Oct 2025, on neocloud revenue approaching about $180B in 2030
- MarketsandMarkets, 27 Mar 2025, on GPUaaS from $8.21B in 2025 to $26.62B in 2030

Those sentences are about the category. They are not Neo Clouds results.
